Build REST API with OIC

- Use Case – **Build REST API with OIC**

  ➢ Enter name, let's say **Raja** and the service will return **Hello Raja**

- Connections to be created/ used

  ➢ REST Connection

- Integration will look like:

  1. Use REST Connection as Trigger (**GET** verb) which will take name (e.g. **Raja**) as input in the form of either query parameter or path variable

  2. Next, Mapper will transform the name to return **Hello Raja**

  3. REST Connection will in turn return the JSON response to the caller

sayHello → **Map to** sayHello → sayHello
